

Apex wrapped outline

	Flow	Simplified Speech
1	(Intro) Heading: AI-powered performance tool Body paragraph: To elevate performance review experience	
2	My role Product manager, design lead. Gathered a team of engineers and designers to build this tool	
3	(Challenge) Performance reviews makes it hard for employees to balance work and lowers overall productivity. Problem: On average it takes about 10 hours each cycle for each employee.	
4	• With 15000 Atlassians, assume 6000 are engineers. = 6000 engineers • Interviews uncovered that it takes about 10 hours each cycle (20 hours annually) for engineers to go through their work and select their high-impact tickets, issues, and documentation. • Assuming \$200,000 is the average salary for an Atlassian engineer, and the average Atlassian works 230 days (260 total working days, 30 days PTO).	

	◦ $\\$200,000 / (230 \times 8) \approx \\$110/\text{hour}$ • $\\$110/\text{hr} \times 20 \text{ hrs annually} \times 6000$ engineers ◦ = Atlassian saves \$13.2 million and 120,000 development hours every year	
5	What was the problem? Areas we're not going to explore based on survey • 81% said the time taken for performance review was an issue • 66.7% felt it impacted their current work • 58.7% were frustrated by the frequency of reviews • 23.8% cited a lack of time with their manager • 19% lacked guidance The two challenges we could meaningfully improve: • 61.9% of respondents struggled to write their self-assessment • 46% struggled to find and collect information about their work.	
6	Design direction: Organize designers in workshop • Define flow (Input, review, output) Design Functionality > Visuals	
7	Challenges with AI design 1. Defining relevancy 2. Defining guardrails	

	3. AI hallucinations 4. Compliance & safety	
8	Defining relevancy • We needed to confirm user input (key word search) • Use LLM to help define the relevancy to the input and grade it (Relevant links, Additional links, Other links) • Review checklist - allow users to define what is relevant	
9	Defining guardrails • Form input design with keywords and formatting links	
10	AI hallucinations • Review screen with links and checkboxes	
11	Compliance & safety • Only have access to your links • Settings where you can block sites that have access to customer data links	
12	Handover to ENG • Back-end & front-end work was eventually distributed • Back-end focused primarily on connecting the AI services and gaining access to all the Atlassian apps • Front-end focused on implementing similar designs	
13	Successful launch • 30%+ adoption in the first cycle • 10,000+ hours saved in H2	

	• Featured in a company-wide design presentation • Rollout supported by Design Operations	
14	Post-launch I made some quick improvements within 2 weeks Envisioning the progression of my features: (with my own visual system) • Added new feature: peer feedback, overall summary. • Improved navigation, progress bar, information architecture.
